#### I. Introduction

On July 6, 2005, the U.S. Environmental Protection Agency (EPA) published final amendments to its 1999 Regional Haze Rule in the Federal Register, including Appendix Y, the final guidance for Best Available Retrofit Technology (BART) determinations (70 FR 39104-39172). The BART rule requires the installation of BART on emission sources that fit specific criteria and "may reasonably be anticipated to cause or contribute" to visibility impairment in any Class I area. Air quality modeling is a means for determining who causes or contributes to visibility impairment. Kansas's proposed protocol for conducting this modeling for BART is provided herein.

The Kansas Department of Health and Environment (KDHE) foresees three purposes for this protocol. First, KDHE will use the protocol to determine what BART-eligible units are subject to BART and must perform a BART analysis. Second, facilities that KDHE notifies are subject to BART will have this protocol to use as a starting point to conduct modeling required when making a BART analyses. Third, KDHE will use this protocol, with potential revisions that would incorporate meteorological observations, to conduct modeling to show visibility impact on Class I areas, once KDHE approves the BART emission limits for facilities subject to BART. This final modeling will be submitted to the EPA as part of the BART section of the Kansas State Implementation Plan (SIP) for regional haze.

New BART guidance, both informal and formal, continues to become available from EPA and the Federal Land Managers (FLMs) that oversee visibility in Class I areas. Kansas has developed a schedule for completing BART analyses and implementing the BART strategy in order to meet SIP deadlines. If the state is to meet those deadlines, modeling to determine sources subject to BART and modeling to make BART analyses may need to be done before all new BART guidance from EPA and the FLMs becomes available. KDHE intends to start modeling to determine sources subject to BART in early April 2006. KDHE will use the draft version of the protocol, which will become final when approved by EPA and the FLMs. KDHE anticipates that it will notify sources subject to BART by the end of May 2006. In the BART determination guidance provided by KDHE, facilities subject to BART will be directed to the final modeling protocol for making BART analyses.

#### II. Background

Generally, Class I areas are national parks and wilderness areas in which visibility is more stringently protected under the Clean Air Act than any other areas in the United States. The Class I areas are shown in Appendix A.

Best Available Retrofit Technology (BART) means an emission limitation based on the degree of reduction achievable through the application of the best system of continuous emission reduction for each pollutant which is emitted by a BART-eligible source. The emission limitation must be established on a unit-by-unit basis, taking into consideration the technology available, the costs of compliance, the energy and non-air quality environmental impacts of compliance, any pollution control equipment in use or in existence at the source,

the remaining useful life of the source, and the degree of improvement in visibility which may reasonably be anticipated to result from the use of such technology. BART requirements, in the form of an agreement to implement BART controls, are a part of the SIP that will be submitted to EPA in late 2007. The SIP is a comprehensive plan of action to increase visibility in the Class I areas, and includes reasonable progress goals in addition to the goals established by sources subject to BART. SIPs are subject to approval by the EPA.

The BART provisions are a part of the overall plan that focuses on reducing emissions from large sources that, due to age, were exempted from other control requirements in the Clean Air Act. An emissions source is considered eligible for BART if it:

- Falls into one of 26 listed categories (essentially the same source categories as those subject to prevention of significant deterioration or PSD, 40 CFR §\$52.21 and 51.166);
- Has the potential to emit at least 250 tons per year of any haze-forming pollutant (primarily  $NO_x$ ,  $SO_2$ , or  $PM_{10}$ ); and
- Existed on August 7, 1977, yet was not in operation before August 7, 1962.

Thus, the BART provisions do not cover all sources that may cause or contribute to visibility impairment in any Class I area.

According to the BART guidance, an individual source is considered to cause visibility impairment if it has a least a 1.0 deciview (dv) impact on the visibility in a Class I area. A source is considered to contribute to visibility impairment if it has at least a 0.5 dv impact.

The BART guidance allows a state to exempt individual sources from the BART requirements if they do not cause or contribute to any impairment of visibility in a Class I area. Exemption is done through air quality modeling. Although the BART guidance does not dictate how such an analysis must be done, it provides direction, which was used to develop this modeling protocol.

The BART analysis process includes several other steps in addition to the modeling described in this protocol. These steps, none of which are addressed in this document, include detailed analysis of:

- Costs of compliance among the various retrofit control options;
- Energy and non-air quality impacts;
- Existing pollution control technologies in use at the BART-eligible unit, particularly with respect to their affecting the choice of retrofit options;
- Remaining useful life of the units and/or facility; and
- Improvements in visibility expected from the use of BART controls.

#### III. BART Air Quality Modeling Approach

One of the air quality modeling approaches suggested by EPA in the BART guidance is an individual source attribution approach. This is the approach Kansas proposes to take. Specifically, this entails modeling source-specific units and comparing modeled impacts to a particular deciview threshold (described above). Kansas has decided to conduct the subject-to-BART modeling, rather than have each BART-eligible facility either conduct the modeling or hire a contractor. This plan will eliminate the need for the State to quickly review many air quality modeling analyses conducted using varying approaches. This plan will also satisfy the need to use a consistent approach among the modeling analyses. Once the subject-to-BART modeling is complete, all the modeling inputs will be available to facilities subject to BART for them or their consultants to conduct modeling for making BART analyses.

The modeling approach discussed here is specifically designed for conducting the subject-to-BART screening analyses. There may be differences between modeling for conducting BART analyses and that for conducting a visibility analysis for a New Source Review permit, which may involve similar emission sources and the same air dispersion model used here.

In preparing this modeling protocol, KDHE consulted BART modeling protocols drafted by other organizations to attain consistency. The four available BART modeling protocols consulted were:

- 1. "Best Available Retrofit Technology (BART) Modeling Protocol to Determine Sources Subject to BART in the State of Minnesota," draft version February 24, 2006;
- 2. "Single Source Modeling to Support Regional Haze BART," version 3, protocol developed by the Lake Michigan Air Directors Consortium (LADCO), draft version September 6, 2005;
- 3. "CALPUFF Modeling Protocol in Support of Best Available Retrofit Technology Determinations," developed by the State of Iowa, draft version August 2005; and 4. "Protocol for BART-Related Visibility Impairment Modeling Analyses in North
- Dakota," developed by the State of North Dakota, draft version September 2005.

This draft protocol is most similar to the Minnesota draft protocol. Kansas is in EPA region VII, and they will be reviewing Kansas's Regional Haze SIP, of which BART will be a part.

KDHE intends to take several steps to complete the BART air quality modeling:

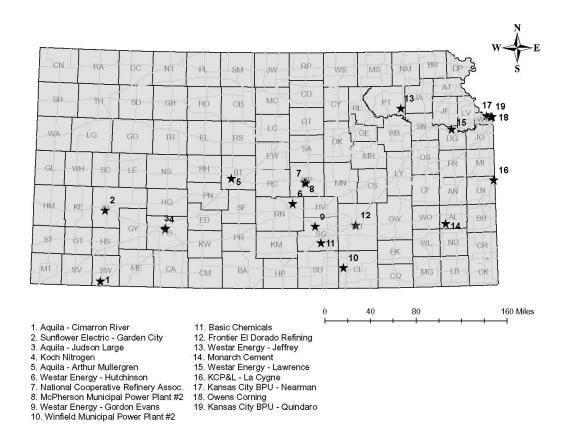

- 1. Send a survey request form to certain facilities in Kansas and, from the response, determine the sources in Kansas that fit the criteria for eligibility (completed 2003);
- 2. Extract the physical characteristics of the BART-eligible units from the survey responses (completed 2005);
- 3. Determine which Class I areas to assess (completed 2005);
- 4. Choose an appropriate air quality model and develop inputs (completed 2006);
- 5. Conduct and post-process the subject-to-BART modeling and evaluate the results
- 6. Notify facilities of the screening results;

- 7. Obtain emission limits and stack parameters resulting from BART analyses made by facilities subject to BART; and
- 8. Conduct follow-up modeling showing the difference between pre- and post-BART analyses.

#### **IV. BART-Eligible Units**

In September 2002, KDHE mailed surveys to facilities that met the Regional Haze Rule's source category criteria under a request for information (RFI) about the air emission units at their facilities. Subsequent analysis of the responses to that request indicated there are 19 facilities in Kansas with BART-eligible units. The results are summarized in Table 1; detailed information on the BART-eligible units based on their response to the RFI is provided in Appendix B. These are the sources that will undergo air quality modeling to determine whether they must undergo an engineering analysis and possibly install BART controls. Figure 1 shows the names and locations of facilities with BART-eligible units in Kansas.

Figure 1. BART-Eligible Facilities in Kansas

**Table 1. Facilities with BART-Eligible Units** 

Facility	Source ID	Location - City	Nearest Class I Area (Distance)	BART-Eligible Unit(s)
Aquila - Arthur Mullergren	0090002	Great Bend	Wichita Mountains (408 km)	Unit 3 (stack 1) - 1041 MMBtu/hr; Unit 3 (stack 2) - 1041 MMBtu/hr

Winfield Municipal Power Plant #2	0350012	Winfield	Wichita Mountains (317 km)	Unit 4 - 333 MMBtu/hr

#### V. Physical Characteristics of BART-Eligible Units

#### A. Emissions

Air emissions data for determining BART eligibility was obtained from facilities through the RFI described above. KDHE requested that the facilities submit emission data for nitrogen oxides ( $NO_x$ ), sulfur dioxide ( $SO_2$ ), particulate matter up to 10  $\mu$ m in size ( $PM_{10}$ ), volatile organic chemicals ( $VOC_s$ ), and ammonia ( $NH_3$ ). Emissions were reported in tons per year, and reflected the potential to emit for each pollutant, in accordance with the 1999 Regional Haze Rule's definition of BART-eligible units. Subsequent to the 2005 Regional Haze Rule and the modeling guidance contained in it, further information regarding the maximum 24-hour actual emissions was requested for each BART-eligible unit. This latter emissions data will be used to model peak 24-hour averages for evaluating visibility.

KDHE does not intend to use emissions of VOCs and ammonia from facilities for subject-to-BART analysis. Only specific VOC compounds form secondary organic aerosols that affect visibility. These compounds are a fraction of the total VOCs reported in the emissions inventory, and KDHE does not have the breakdown of VOC emissions necessary to model those that only impair visibility. Further, the prescribed screening model (CALPUFF) cannot simulate formation of particles from anthropogenic VOCs, nor their visibility impacts. Ammonia from specific sources will not be evaluated in this process, although ammonia is included in the modeling as a background concentration—this will be discussed later in this modeling protocol. The appropriate VOCs and ammonia emission data can, and will be, included in regional scale modeling used for the Regional Haze SIP.

#### **B.** Stack parameters

Stack parameters for modeling were obtained from the State's emission inventory database. The parameters are: height of the stack opening from ground, inside stack diameter, exit gas flow rate, exit gas temperature, base elevation above sea level, and location coordinates of the stack. Because the modeling conducted for BART is concerned with long-range transport, not localized impacts, the RFI did not include data about building heights and widths that are used to calculate downwash. Details on the stack parameters to be used as inputs in the modeling are provided in Appendix B.

#### VI. Class I Areas to Assess.

There are no Mandatory Federal Class I areas located in the state of Kansas. The closest Class I areas to potential Kansas BART sources are the Wichita Mountains in Oklahoma and Hercules-Glades Wilderness Area in Missouri. These two Class I areas will be the focus of the BART visibility analysis for most Kansas sources. Impact to other surrounding Class I areas will also be evaluated. The list of nine Class I areas which will be included in the modeling analysis are depicted in Table 2. Table 2a lists the calculated distances, in kilometers, between the 19 BART-eligible sources and nine Class I areas that will be evaluated. Figure 2 shows the location of each Class I area to be evaluated.

**Table 2. Class I Areas Evaluated for BART** 

Class I Area	State	Name
Badlands National Park	SD	BADL1
Caney Creek Wilderness Area	AR	CACR1
Great Sand Dunes National Park and Preserve	CO	GRSA1
Hercules-Glades Wilderness Area	MO	HEGL1
Mingo Wilderness Area	MO	MING1
Rocky Mountain National Park	CO	ROMO1
Upper Buffalo Wilderness Area	AR	UPBU1
Wichita Mountains Wilderness Area	OK	WIMO1
Wind Cave National Park	SD	WICA1

#### VII. Air Quality Model and Inputs

According to the final Regional Haze Rule's BART guidance, a State "can use CALPUFF or other appropriate model to predict the visibility impacts from a single source at a Class I area." For purposes of the BART analysis, KDHE intends to use CALPUFF. The KDHE recognizes that CALPUFF has limited ability to simulate the complex atmospheric chemistry involved in the estimation of secondary particulate formation. However, for purposes of the subject-to-BART analysis, KDHE intends to use CALPUFF for the following reasons:

- 1. The increased level of effort required for conducting particulate apportionment in the regional scale, full-chemistry Eulerian model (CAMx) to acquire individual source contributions to Class I areas, relative to the simplicity of the CALPUFF model;
- 2. The lack of a plume-in-grid feature with the particulate apportionment technique currently available in CAMx;
- 3. The desire to be consistent with other CENRAP states, which all (except Texas and Iowa) appear to be using CALPUFF;
- 4. The limited scope of what this modeling is to determine; and
- 5. The additional modeling of BART controls that will be conducted as part of the Regional Haze SIP with the CAMx or CMAQ model(s). EPA's BART guidance states that States should follow the EPA's Interagency Workgroup on Air Quality Modeling (IWAQM) guidance, Phase 2 recommendations for long-range transport. The IWAQM guidance was developed to address air quality impacts as assessed through the Prevention of Significant Deterioration (PSD) program at Class I areas, where the source generally is located beyond 50 km of the Class I area. The IWAQM guidance does not specifically address the type of assessment that will occur with the BART analysis.

#### **CALPUFF Modeling**

CALPUFF modeling will be performed on all Kansas BART-eligible sources. KDHE intends to closely follow the CENRAP CALPUFF modeling protocol for most of the settings and inputs. It is important to note that the majority of potential Kansas BART sources are beyond 250 km to the nearest Class I area. The use of puff splitting in the initial screening modeling was attempted, but found computationally prohibitive on the current domain; thus puff splitting will not be employed is this modeling.

#### A. Modeling domain

The CALPUFF modeling will be conducted on the CENRAP central 6 km grid. The extent of the proposed CALPUFF domain is shown in Figure 2.

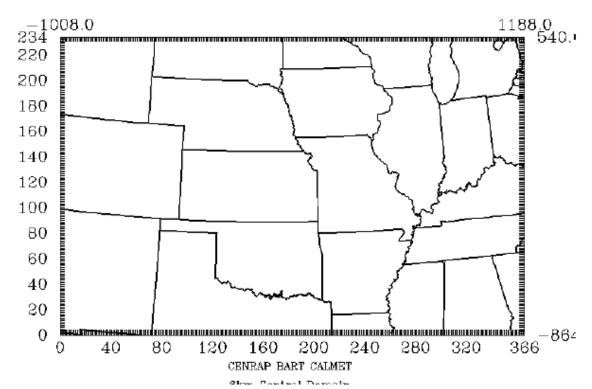

Figure 2. 6 km CENRAP Central CALPUFF Domain

CALPUFF will be applied to each source for three annual simulations spanning the years 2001 through 2003. The IWAQM guidance allows the use of fewer than 5 years of meteorological data if a meteorological model using four-dimensional data assimilation is used to supply data. This is the case in this modeling analysis. See the section on meteorology for more information.

#### **B.** CALPUFF system implementation

There are three main components to the CALPUFF model:

- 1. Meteorological Data Modeling (CALMET);
- 2. Dispersion Modeling (CALPUFF); and
- 3. Postprocessing (CALPOST)

Versions of the modeling components to use in this BART analysis are shown in Table 3, which follows.

**Table 3. CALPUFF Modeling Components** 

Processor	Version	Level
TERREL	3.311	030709
CTGCOMP	2.42	030709
CTGPROC	2.42	030709
MAKEGEO	2.22	030709
CALMM5	2.4	050413
CALMET	5.53a	040716
CALPUFF	5.753	051130
POSTUTIL	1.4	040818
CALPOST	5.6392	051130

The specific use of each of these components in the BART analysis is described in more detail below.

Because the KDHE is proposing to use a later version of the CALPUFF system rather than the EPA approved regulatory version, we have performed a test run with both systems to ensure identical results between the two systems. This analysis can be found in Appendix E. The results indicate that the proposed version of CALPUFF gives identical results as the regulatory version.

#### C. Meteorological data modeling (CALMET)

KDHE will use the 2001-2003 CENRAP-developed CALMET dataset for its modeling. For additional information on the settings used to develop this dataset, refer to the CENRAP BART Modeling Guidelines document in Appendix C.

Note that no observation data was used in the CALMET outputs developed by CENRAP. This means the prognostic meteorological data set from MM5 is not supplemented with surface or upper air observations during the CALMET processing. The use of observations is thought to counterbalance smoothing that may occur when using the coarse grid scale of the MM5 data. Both the EPA and FLMs commented on the draft CENRAP guidelines that observations should be used in refined CALPUFF modeling. KDHE is recommending that observations be incorporated into a refined modeling analysis, but not in this screening analysis.

Appendix C contains the CENRAP BART Modeling Guidelines, which discuss the full suite of settings used to generate the CALMET data.

#### D. Dispersion modeling (CALPUFF)

The CALMET output is used as input to the CALPUFF model, which simulates the effects of the meteorological conditions on the transport and dispersion of pollutants from an individual source. In general, KDHE proposes to use the recommended default options in the CALPUFF model. There are some deviations, which are discussed below. CALPUFF is considered most applicable for sources located between 50 km and 250 km of the Class I area; in Kansas, the majority of BART-eligible units are beyond 250 km. The CALPUFF

model has a puff-splitting option that splits puffs that become large over greater transport distances. KDHE does not initially intend to invoke puff-splitting for these more distant sources, due to excessive computational run times. However, KDHE proposes to use puff-splitting when performing more refined modeling on a smaller grid. The following species will be modeled and/or emitted in this BART analysis:

**Table 4. Species Modeled in BART Analysis** 

Species	Modeled	Emitted	Dry Deposited
$SO_2$	Yes	Yes	Computed-gas
$SO_4$	Yes	No	Computed-particle
NO <sub>x</sub>	Yes	Yes	Computed-gas
HNO <sub>3</sub>	Yes	No	Computed-gas
NO <sub>3</sub>	Yes	No	Computed-particle
PM-fine	Yes	Yes	Computed-particle
PM-coarse	Yes	Yes	Computed-particle

Note that in the case of a source where the PM profile for sulfate (SO<sub>4</sub>), elemental carbon (EC), and secondary organic aerosols (SOA) are known, SO<sub>4</sub> will be modeled as a separate species in CALPUFF if that source is close to the visibility contribution threshold. This will not be necessary in most cases, as many sources will be either clearly impacting or clearly not impacting a Class I area, and in many cases the PM profile will not be known.

Particle size parameters are entered in the CALPUFF input file for dry deposition of particles. There are default values for "aerosol" species (i.e., SO<sub>4</sub>, NO<sub>3</sub>, and PM<sub>2.5</sub>). The default value for each of these species is 0.48 µm geometric mass mean diameter and 2.0 µm geometric standard deviation. Where the facility is able to supply emissions of PM<sub>2.5</sub>, the default values may be appropriate. However, many facilities may not be able to supply PM<sub>2.5</sub> emissions and will supply what is available, PM<sub>10</sub> emissions data. In this case, using the default values may underestimate deposition of particulates and overestimate the particulate contribution to visibility. For sources that did not report PM<sub>2.5</sub> emissions in the RFI, KDHE intends to speciate PM<sub>10</sub> emissions to PM<sub>2.5</sub> and PM course by using the PM<sub>2.5</sub>/ PM<sub>10</sub> ratio reported to or calculated by KDHE for the 2002 emissions inventory. The KDHE request for information described above did not request that sources indicate how much of their particulate emissions might be elemental carbon or secondary organic aerosol. The light extinction coefficient for PM<sub>2.5</sub> is 1, for EC is 10, and for SOA is 4. Thus, EC and SOA will have a comparatively higher impact on visibility. The main sources of these particles are fuel combustion. A way to account for this, without including EC and SOA in the modeling, is to use particle speciation in the post-processing step. This is discussed below in the CALPOST section.

**Ozone and ammonia concentrations:** Ozone (O<sub>3</sub>) and ammonia (NH<sub>3</sub>) can be input to CALPUFF as hourly or monthly background values. Hourly values of ozone concentrations were obtained from three rural monitoring sites in Kansas, Peck, Mine Creek, and Cedar Bluff monitors. These hourly ozone values will be used in this modeling. Background ammonia concentration is assumed to be temporally and spatially invariant and will be fixed

at 3 ppb across the entire domain for all months. It may be possible to derive NH<sub>3</sub> concentrations from regional modeling outputs that CENRAP is currently developing. At this time these NH<sub>3</sub> values are not available in a model ready form.

**Receptors:** Receptors are locations where model results are calculated and provided in the CALPUFF output files. Receptor locations were derived from the National Park Service's Class I area receptor database at <a href="http://www2.nature.nps.gov/air/maps/receptors/index.cfm">http://www2.nature.nps.gov/air/maps/receptors/index.cfm</a>. Only these discrete NPS receptors will be modeled in CALPUFF. The discrete receptors are necessary for calculating visibility impacts in the nine selected Class I areas that will be evaluated by KDHE. All the discrete receptors will be placed with enough density that the highest visibility impacts should be evident. The NPS provides receptors in all the Class I areas on a 1 km basis. These receptors will be kept at the 1 km spacing for the BART modeling, and all receptors will be retained.

**Outputs:** The CALPUFF modeling results will be displayed in units of micrograms per cubic meter ( $\mu g/m^3$ ). In order to determine visibility impacts, the CALPUFF outputs must be post-processed.

Detailed information on all CALPUFF setting to be used in this screening can be found in Appendix D.

#### E. Post-processing (CALPOST)

Hourly concentration outputs from CALPUFF are processed through POSTUTIL and CALPOST to determine visibility conditions. Specifically, POSTUTIL takes the concentration file output from CALPUFF and recalculates the nitric acid and nitrate partition based on total available sulfate and ammonia. CALPOST uses the concentration file processed through POSTUTIL, along with relative humidity data, to perform visibility calculations. For the BART analysis, the only modeling results out of the CALPUFF modeling system of interest are the visibility impacts. Please see Appendix E and F for detailed settings for POSTUTIL and CALPOST.

**Light extinction:** Light extinction must be computed in order to calculate visibility. CALPOST has seven methods for computing light extinction. This BART screening analysis will use Method 6, which computes extinction from speciated particulate matter with monthly Class I area-specific relative humidity adjustment factors, and is implied by the BART guidance. Relative humidity is an important factor in determining light extinction (and therefore visibility) because sulfate and nitrate aerosols, which absorb moisture from the air, have greater extinction efficiencies with greater relative humidity. This BART analysis will apply relative humidity correction factors (*f*(RH)s) to sulfate and nitrate concentrations outputs from CALPUFF, which were obtained from EPA's "Guidance for Estimating Natural Visibility Conditions under the Regional Haze Rule (EPA, 2003). The *f*(RH) values for the Class I areas that will be assessed are provided in Table 5.

Table 5. Monthly Averaged f(RH) Based on Centroid of the Class I Area

Class I Area	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Badlands	2.6	2.7	2.6	2.4	2.8	2.7	2.5	2.4	2.2	2.3	2.7	2.7

Wichita	2.7	2.6	2.4	2.4	3.0	2.7	2.3	2.5	2.9	2.6	2.7	2.8
Mountains												
Wind Cave	2.5	2.5	2.5	2.5	2.7	2.5	2.3	2.3	2.2	2.2	2.6	2.6

The PM<sub>2.5</sub> concentrations are considered part of the dry light extinction equation and do not have a humidity adjustment factor. The light extinction equation is the sum of the wet sulfate and nitrate and dry components PM<sub>2.5</sub> plus Rayleigh scattering, which is 10 inverse megameters (Mm<sup>-1</sup>).

To account for sources modeled with a known PM speciation profile for EC, SOA, and SO<sub>4</sub>, an adjustment to the extinction coefficient for the PM components will be made in CALPOST. KDHE intends to follow the method outlined in the FLM CALPUFF Reviewer's Guide.

#### VIII. Visibility Impacts

Perceived visibility in deciviews is derived from the light extinction coefficient. The visibility change related to background is calculated using the modeled and established natural visibility conditions. For this BART analysis, daily visibility will be expressed as a change in deciviews compared to natural visibility conditions.

The annual average natural levels of aerosol components at each Class I area are shown in Table 6. Natural conditions by component in this Table are based on whether the Class I area is in the eastern or the western part of the United States. In this BART analysis, some Class I areas are located in the East and some in the West. This data is in EPA's "Guidance for Estimating Natural Visibility Conditions Under the Regional Haze Rule (EPA, 2003).

Table 6 - Average Annual Natural Levels of Aerosol Components (μg/m³)

Class I Area	Region	SO <sub>4</sub>	$NO_3$	OC	EC	Soil	<b>Coarse Mass</b>
Badlands	WEST	0.12	0.10	0.47	0.02	0.50	3.00
Caney Creek	EAST	0.23	0.10	1.40	0.02	0.50	3.00
Great Sand Dunes	WEST	0.12	0.10	0.47	0.02	0.50	3.00
Hercules-Glades	EAST	0.23	0.10	1.40	0.02	0.50	3.00
Mingo	EAST	0.23	0.10	1.40	0.02	0.50	3.00
Rocky Mountain	WEST	0.12	0.10	0.47	0.02	0.50	3.00
Upper Buffalo	EAST	0.23	0.10	1.40	0.02	0.50	3.00
Wichita Mountains	WEST	0.12	0.10	0.47	0.02	0.50	3.00
Wind Cave	WEST	0.12	0.10	0.47	0.02	0.50	3.00

In a cooperative agreement with EPA Regions VI and VII and federal land managers, CENRAP guidance deviates from use of the 98<sup>th</sup> percentile impact. The CALMET datasets as described in this protocol were processed with the "No-Obs" options (i.e., surface observations were not used in the CALMET wind field interpolation). Aware that exercising CALMET with No-Obs may lead in some applications to potentially less conservatism in the CALPUFF visibility results compared with the use of CALMET with observations, CENRAP has agreed to EPA's recommendation that the maximum visibility impact, rather than the 98<sup>th</sup> percentile value, should be used for screening analyses using the CENRAP-developed CALMET datasets. This approach will be used in this screening analysis.

Sources with modeled maximum impacts below the 0.5 dv threshold will be exempt from the remainder of the BART process. Sources with impacts at or above 0.5 dv will be allowed a reasonable window of time, during which they can either perform more refined CALPUFF modeling to show their visibility impact is in fact below the 0.5 dv threshold, or they can modify their Title V air operating permit to reduce the potential to emit (PTE) for their BART-eligible units to below BART eligibility values for haze-forming pollutants. The remaining sources must continue with the BART process and perform a BART analysis. This analysis will likely include more refined CALPUFF modeling, using observations coupled with the 98<sup>th</sup> percent impact, finer grid resolution, puff splitting, focused domain, etc.

#### IX. Change in Visibility Due to BART Controls

Once facilities perform their BART analysis and BART emission limits are established, KDHE will conduct additional CALPUFF modeling in order to establish visibility improvement at Class I areas with BART applied. The post-control CALPUFF simulation will be compared to the pre-control CALPUFF simulation by calculating the change in visibility over natural conditions between the pre-control and post-control simulations. As mentioned above, KDHE will make available the CALPUFF input files used for determining sources subject to BART, which facilities may use when making their own BART determination.

Upon completion of the CALPUFF screening runs, the KDHE will determine if additional technical guidance or CALMET model data is available that includes surface and upper air observations. This refined modeling, if available, will be used along with an amended protocol for performing additional CALPUFF modeling in order to establish visibility improvement at Class I areas. It is also likely that some sources will undertake and provide refined modeling that can be used for evaluating visibility improvement. These refinements would be utilized in this later modeling.

Sources performing refined modeling will be required to submit a modeling protocol to the department for approval. Protocols should also be made available concurrently to EPA and FLM's for their review. The KDHE and EPA will also be requesting modeling inputs used in the modeling process. Sources using KDHE's modeling protocol and modeling inputs will not be required to provide a full modeling protocol. The KDHE has a BART analysis guidance document to assist sources in the BART analysis process. This document is available upon request.

# **Appendix D – CALPUFF Control File Inputs**

Variable	Description	Value	Default	Comments
	INPUT GROUP 1: G	eneral ru	ın control j	parameters
METRUN	Control parameter for running all periods in met. File (0=no; 1=yes)	0	Y	
IBYR	Starting year of the CALPUFF run	2002	n/a	2001 and 2003 are the other years modeled
IBMO	Starting month	1	n/a	
IBDY	Starting day	1	n/a	
IBHR	Starting hour	1	n/a	
XBTZ	Base time zone	6.0	n/a	Central Standard Time
IRLG	Length of the run (hours)	8760	n/a	2001=8760hrs, 2003=8748hrs only 12 hrs on 12/31
NSPEC	Total number of species modeled	7	5	
NSE	Number of species emitted	4	3	
METFM	Meteorological data format	1	Y	CALMET unformatted file
AVET	Averaging time (minutes)	60.0	Y	
PGTIME	Averaging time (minutes) for PG - $\sigma_v$	60.0	Y	
	INPUT GRO	UP 2: Teo	chnical opti	ions
MGAUSS	Control variable determining the vertical distribution used in the near field	1	Y	Gaussian
MCTADJ	Terrain adjustment method	3	Y	Partial plume path adjustment
MCTSG	CALPUFF sub-grid scale complex terrain module (CTSG) flag	0	Y	CTSG not modeled
MSLUG	Near-field puffs are modeled as elongated "slugs"?	0	Y	No
MTRANS	Transitional plume rise modeled?	1	Y	Transitional plume rise computed
MTIP	Stack tip downwash modeled?	1	Y	Yes
MBDW	Method used to simulate building downwash?	1	Y	ISC method
MSHEAR	Vertical wind shear above stack top modeled in plume rise?	0	Y	No
MSPLIT	Puff splitting allowed?	0	Y	No
MCHEM	Chemical mechanism flag	1	Y	Transformation rates computed internally (MESOPUFF II scheme)
MAQCHEM	Aqueous phase transformation flag	0	Y	Aqueous phase not modeled
MWET	Wet removal modeled?	1	Y	Yes
MDRY	Dry deposition modeled?	1	Y	Yes
MDISP	Method used to compute dispersion coefficients	3	Y	PG dispersion coefficients in RURAL & MP coefficients in urban areas
MTURBVW	Sigma-v/sigma-theta, sigma-w measurements used?	3	Y	Use both sigma-(v/theta) and sigma-w from PROFILE.DAT Note: not provided

Variable	Description	Value	Default	Comments
MDISP2	Backup method used to compute dispersion when measured turbulence data are missing	3	Y	PG dispersion coefficients in RURAL & MP coefficients in urban areas
MROUGH	PG sigma-y,z adj. for roughness?	0	Y	No
MPARTL	Partial plume penetration of elevated inversion?	1	Y	Yes
MTINV	Strength of temperature inversion	0	Y	No
MPDF	PDF used for dispersion under convective conditions?	0	Y	No
MSGTIBL	Sub-Grid TIBL module used for shoreline?	0	Y	No
MBCON	Boundary conditions (concentration) modeled?	0	Y	No
MFOG	Configure for FOG model output	0	Y	No
MREG	TEST options specified to see if they conform to regulatory values?	1	Y	Checks made
	INPUT G	ROUP 3:	Species list	t
CSPEC	Species modeled	SO2 SO4 NOX HNO3 NO3 PM25 PM10	n/a	Modeled: All Emitted: SO2, NOx, PM25, PM10 Dry deposited: SO2(gas), SO4(particle), NOx(gas), HNO3(gas), NO3(particle), PM25(particle), PM10(particle)
	INPUT GROUP 4: Map pr	ojection	and grid co	ontrol parameters
PMAP	Map projection	LCC	N	Lambert conformal conic
FEAST	False Easting	0.0	Y	
FNORT	False Northing	0.0	Y	
RLATO	Latitude	40N	n/a	
RLONG	Longitude	97W	n/a	
XLAT1	Matching parallel(s) of latitude	33N	n/a	
XLAT2	for projection	45N	n/a	
DATUM	Datum region for the coordinates	WGS- G	N	WGS-84 GRS 80 spheroid, global coverage (WGS84)
NX NY NZ	Meteorological grid: No. X grid cells in meteorological grid No. Y grid cells in meteorological grid No. vertical layers in meteorological grid	366 234 10	n/a	
DGRIDKM	Grid spacing (km)	6	n/a	
ZFACE	Cell face heights (m)	0, 20, 40,80, 160, 320, 640, 1200,	n/a

Variable	Description	Value	Default	Comments
	INPUT GROUP 1: General r	un contro	ol paramete	ers
ISYR	Starting Year	2002	n/a	2001 and 2003 also modeled
ISMO	Starting month	1	n/a	
IDY	Starting day	1	n/a	
ISHR	Starting hour	1	n/a	
NPER	Number of periods to process	8760	n/a	2001=8760 hrs, 2003=8748hrs only 12 hrs on 12/31
NSPECINP	Number of species to process from CALPUFF runs	7	n/a	
NSPECOUT	Number of species to write to output file	7	n/a	
NSPECCMP	Number of species to compute from those modeled	0	n/a	
MDUPLCT	Stop run if duplicate species names found?	0	Y	
NSCALED	Number of CALPUFF data files that will be scaled	0	Y	
MNITRATE	Re-compute the HNO3/NO3 partition for concentrations?	1	N	Yes, for all sources combined
BCKNH3	Default ammonia concentrations used for HNO3/NO3 partition	-	N	12*3
	INPUT GROUP 2: Species p	rocessing	informatio	on
ASPECI	NSPECINP species will be processed	-	n/a	SO2, SO4, NOx, HNO3, NO3, PMC, PMF
ASPECO	NSPECOUT species will be written	-	n/a	SO2, SO4, NOx, HNO3, NO3, PMC, PMF

# **Appendix F – CALPOST Control File Inputs**

Variable	Description	Value	Default	Comments
	INPUT GROUP 1: General 1	run contro	ol paramete	rs
METRUN	Option to run all periods found in met files	0	Y	Run period explicitly defined
ISYR	Starting Year	2002	n/a	2001 and 2003 also modeled
ISMO	Starting month	1	n/a	
IDY	Starting day	1	n/a	
ISHR	Starting hour	1	n/a	
NHRS	Number of hours to process	8760	n/a	2001=8760hrs, 2003=8748hrs only 12 hrs on 12/31
NREP	Process every hour of data?	1	Y	Every hour processed
ASPEC	Species to process	VISIB	n/a	Visibility processing
ILAYER	Layer/deposition code	1	Y	CALPUFF concentrations
A, B	Scaling factors $X(new) = X(old) *A + B$	0, 0	Y	
LBACK	Add hourly background concentrations/fluxes?	F	Y	
MSOURCE	Option to process source contributions	0	Y	
LG	Gridded receptors processed?	F	N/Y	Receptors located only in
LD	Discrete receptors processed?	T		the Class I areas assessed
LCT	CTSG Complex terrain receptors processed?	F	Y	
LDRING	Report results by DISCRETE receptor RING?	F	Y	
NDRECP	Flag for all receptors after the last one assigned is set to "0"	-1	Y	
IBGRID JBGRID IEGRID JEGRID	Range of gridded receptors	-1 -1 -1 -1	Y	When LG = T Entire grid processed if all =-1
NGONOFF	Number of gridded receptor rows provided to identify specific gridded receptors to process	0	Y	
BTZONE	Base time zone for the CALPUFF simulation	6	n/a	
MFRH	Particle growth curve f(RH) for hygroscopic species	2	Y	FLAG (2000) f(RH) tabulation. Note: not used
RHMAX	Maximum relative humidity (%) used in particle growth curve	-	N	Not used
LVSO4	Modeled species to be included in	Т	Y	
LVNO3	computing light extinction	T	Y	
LVOC		F	N	
LVPMC		T	Y	
LVPMF		T	Y	
LVEC		F	N	
LVBK	Include BACKGROUND when ranking for TOP-N, TOP-50, and exceedence tables?	Т	Y	
SPECPMC	Species name used for particulates in	PMC	Y	
DI LCI IVIC	opecies name used for particulates III	1 1/1	1	

Variable	Description	Value	Default	Comments
SPECPMF	MODEL.DAT file	PMF	Y	
EEPMC	Modeled particulate species	0.6	Y	
EEPMF		1.0	Y	
EEPMCBK	Background particulate species	0.6	Y	
EESO4	Other species	3.0	Y	
EENO3		3.0	Y	
EEOC		4.0	Y	
EESOIL		1.0	Y	
EEEC		10	Y	
LAVER	Background extinction computation	F	Y	
MVISBK	Method used for background light extinction	6	N	Compute extinction from speciated PM measurements. FLAG RH adjustment factor applied to observed and modeled sulfate and nitrate
RHFAC	Extinction coefficients for hygroscopic species (modeled and background). Monthly RH adjustment factors	-	n/a	See Table 5 in main protocol document
BKSO4 BKNO3 BKPMC BKOC BKSOIL BKEC	Monthly concentrations of ammonium sulfate, ammonium nitrate, coarse particulates, organic carbon, soil and elemental carbon to compute background extinction coefficients	-	n/a	See Table 6 in main protocol document
BEXTRAY	Extinction due to Rayleigh scattering (1/Mm)	10	Y	
IPRTU	Units for all output	1	Y	grams/cubic meter
L24HR	Averaging time reported	T	n/a	
LTOPN	Visibility: Top "N" table for each averaging time selected.	F	Y	
NTOP	Number of 'Top-N' values at each receptor selected (NTOP must be <=4)	4	Y	
MDVIS	Output file with visibility change at each receptor?	0	Y	Create file of DAILY (24 hour) delta-deciview. Grid model run.

#### Appendix E – CALPUFF Comparison – Regulatory vs. Proposed

The regulatory version of CALPUFF is Version: 5.7, Level: 030402. The KDHE is proposing to use Version: 5.753, Level: 051130. The regulatory version of CALPOST is CALPOST Version 5.4, Level 030402. The KDHE is proposing to use Version 5.6392, Level 051130.

To ensure our proposed version of the models would not lead to differences in results we ran one source using both versions of the models for 1 year and evaluated deciview impacts in all 9 Class I areas. The resulting number of deciview impacts > 0.5 was the same at all Class I areas. In addition, the daily impacts were also identical.

The two tables below show the number of impacts > 0.5 dv and the daily comparison of visibility impacts, in delta dv for one of the Class I areas.

Class I Area	DV > 0.5	DV > 0.5
	Regulatory	Proposed
Badlands	1	1
Caney Creek	10	10
<b>Great Sand Dunes</b>	0	0
Hercules-Glades	8	8
Mingo	5	5
Rocky Mountain	0	0
Upper Buffalo	8	8
Wichita Mountains	2	2
Wind Cave	1	1

Comparison of the daily delta deciview impacts in Caney Creek in 2003 using both the regulatory and proposed version of CALPUFF and CALPOST.
